

Design Brief 1: "For You"

Project: Recz App Redesign — For You Page

Document Type: Experience Design Brief

Audience: Lead UI/UX Designer

Version: 1.0

Context

Recz is a social intelligence platform built on a simple premise: people trust people. The app converts social recommendations into lived experiences, powered by a trust-weighted graph and Remy, its AI concierge. The current app has known UX deficiencies. This redesign is a full rethink — not a refinement.

The designer has the app installed. This brief does not describe what the current experience is. It describes what the new "For You" page must *accomplish*, not how.

What This Page Is

For You is the home screen and the product's single most important surface. It is the user's daily recommendation digest — a living, intelligent summary of everything the Recz ecosystem knows about them.

This is not a social feed. Users should never feel like they are scrolling through posts. They are arriving at a screen that already knows them, has done the work for them, and is waiting with purpose.

The goal is retention through relevance. The screen must create a loop that users return to daily — not because they are addicted to scrolling, but because the screen consistently surfaces something they care about, something they forgot, or something that feels perfectly timed.

What It Must Do

Personalized Recommendation Surface

The page aggregates and summarizes signals from across the app — posts from the user's network, their saved items, lists they've created or followed, bookmarks they haven't acted on, places they intended to visit, books on their reading list, and more. These signals must surface as curated, digestible moments — not as posts, not as a feed. Each entry should feel like it was placed there with intent.

The designer must solve for surfacing the right thing at the right depth. Some items warrant a glance; others invite deeper exploration. The page should support both.

Context-Aware, Dynamic Greeting

The screen should greet the user in a way that reflects their world right now. Time of day, day of the week, local weather, season, upcoming festivals, cultural moments, and regional events should all inform how the page opens. A Monday morning feels different from a Friday evening. A rainy afternoon is different from a sunny weekend. The page should *feel* that difference without being told.

This is not a banner or a widget. It is the personality of the screen.

Social & Events Layer

If a connection is celebrating a birthday, that moment should have presence on this screen. The user should be able to respond in a way that is native to Recz — gifting a recommendation, not a generic message.

Registered events, public and religious holidays, and cultural moments should also surface here in a way that creates relevance and connection — not noise.

Mood Dynamics

The page is mood-aware. The content hierarchy, visual tone, and recommendations should shift based on a combination of time, weather, and the user's expressed or inferred mood. The designer must find a way to make mood-setting a natural, delightful part of the experience — one the user actually wants to engage with, not a settings screen they visit once and forget.

This is one of the most creatively open challenges in this brief. How the user sets or the system infers mood, and how the page visibly responds to it, is entirely the designer's canvas.

The Endless Loop

The page must never run dry. The user should always have somewhere to go — a forgotten save, a trending item from their circle, a rec they've been sitting on, something seasonal, something spontaneous. The architecture of the page must be designed so that depth is always available without the user having to search for it.

This is not about infinite scroll. It is about intelligent surfacing that makes the user feel like the app knows them better each time they open it.

Rexy Access

Rexy — the app's AI concierge — is available throughout the app, but its presence and invocation on this screen needs to feel especially natural. The user should never wonder how to access it, and it should never feel like a chatbot button tucked into a corner. How Rexy is surfaced on this page, and what it means to invoke it from this context, is a key design challenge.

Design Principles for This Screen

- **Intention over stimulation.** Every element on the page should earn its place. Nothing is there to fill space or capture attention for its own sake.
 - **Familiarity without repetition.** The user should recognise the structure of the screen while never seeing the same content twice in a meaningful window.
 - **Human warmth, not algorithmic coldness.** The page should feel like it was composed by someone who knows you — not generated by a machine.
 - **Action-forward.** Every piece of content should have a clear next step. Inspiration without a path forward is noise.
 - **Modern without being trendy for its own sake.** The design system should draw from contemporary UI patterns — including fluid, layered, and material-aware aesthetics — where they serve the experience. Not as decoration.
-

What the Designer Should Decide

The following are explicitly left open for the designer:

- The visual layout, hierarchy, and structural metaphor of the page
 - How content categories and recommendation clusters are expressed
 - The interaction model for mood input and response
 - How the greeting layer is visually and spatially integrated
 - How Remy is represented and invoked in this context
 - How birthday and event moments are surfaced without interrupting the experience
 - How depth and the endless loop are navigated
 - The motion language and micro-interaction system for the page
-

Success Criteria

The redesigned For You page succeeds if:

1. A first-time user understands what the screen is for within five seconds — without onboarding.
 2. A returning user finds something relevant every single time they open it.
 3. The experience of the screen is meaningfully different at 8am, 2pm, and 10pm.
 4. The user can access Remy without thinking about it.
 5. Social moments (birthdays, events) feel warm and considered — not like notifications.
 6. The page creates a reason to open the app that is separate from any other tab or feature.
-

Constraints

- Must be designed mobile-first (iOS and Android parity).
- Must be part of a cohesive design system being built in parallel for the entire app. Patterns introduced here will be inherited downstream.

- Must avoid patterns that 2026 users have been trained to distrust: opaque algorithmic feeds, notification-bait, passive infinite scroll, or engagement mechanics that feel manipulative.

The current app experience is the baseline to depart from, not the reference to improve upon. The goal is a page that makes users feel understood — and keeps them coming back because of it.
